# INTRODUCTION

Many utility companies rely on burying their distribution network plant beneath the street and elsewhere for security, safety and aesthetic reasons. However, that plant does not have an infinite life and can be subject to stresses that can cause failure in the future; knowing exactly where that plant is buried can become a challenge later. Some types of buried plant are extremely difficult to locate precisely from above ground; most notably those which are electrically non-conductive, such as gas and water pipes and communication ducts carrying only optical fibres.

We present our system that can be used to aid the marking, surveying, geo-tagging and future precision location of plant, particularly useful with the non-conductive types. Also, various locators and other tools useful for tracing buried cables and ducts and give details of some which are targeted at the “irrigation” market; tracing shallow buried cables and identifying solenoid valves etc.

Many buried utilities that are in use, are well over 40 years old and often as old as 100 years, therefore any records, should they exist are completely out of date; where a pipeline or duct was installed a certain distance from the kerb of a road, that was when the road was just two lanes and no longer relates to the modern four lane highway that may have also changed direction and position relative to the centre line.

The important questions that must be answered before digging in the ground are:

1. Where is it?
2. What is it?
3. Does it tally with the known records?
4. Can you see everything?
5. Am I safe to dig?

Tempo provides a one-year manufacturer’s warranty on all products.

- Does not locate the cable path which has to be predetermined and only in direct burial applications. 5M ohm and less.
- 10,000 ohms and less—both ends isolated from grounds.
- Can trace coax if transmitter is connected to braid/outer shield.
- Will trace coax if transmitter is connected to braid/outer shield providing the bond is in place at the remote end—will disrupt service.
- Direct Connection 4,000 ft at 7 ft deep. Inductive Coupler 1,000 ft at 3 ft deep. Inductive Antenna 700 ft at 3 ft deep.
- Low frequency locators need a “path to earth” (dirt), 5000 ft. on an open conductor and 2500 ft. on a metallic pipe at 3 ft. deep.
- Orientation of antenna depends on how you hold the coil for each application, e.g. null for below ground wire tracing, peak for behind walls, etc.

# MULTIMETERS

## Meeting today's stringent safety standards is essential.

Tempo's certification of selected instruments to both the most recent IEC and UL requirements brings you assurance of the highest level of protection currently available.

## What you should know about Measurement Category ratings.

IEC Category standards specify protection levels that are far above a system's rated capacity. Without this additional protection, transient overvoltages, which are becoming increasingly common, can lead to serious injury or death.

**Measurement Category I** is the signal level for telecommunications and electronic equipment or other circuits that are not directly connected to the utility mains.

**Measurement Category II** is the local level for fixed or nonfixed powered devices - everything from lighting to appliances to office equipment such as copiers; may also be used in Category I areas.

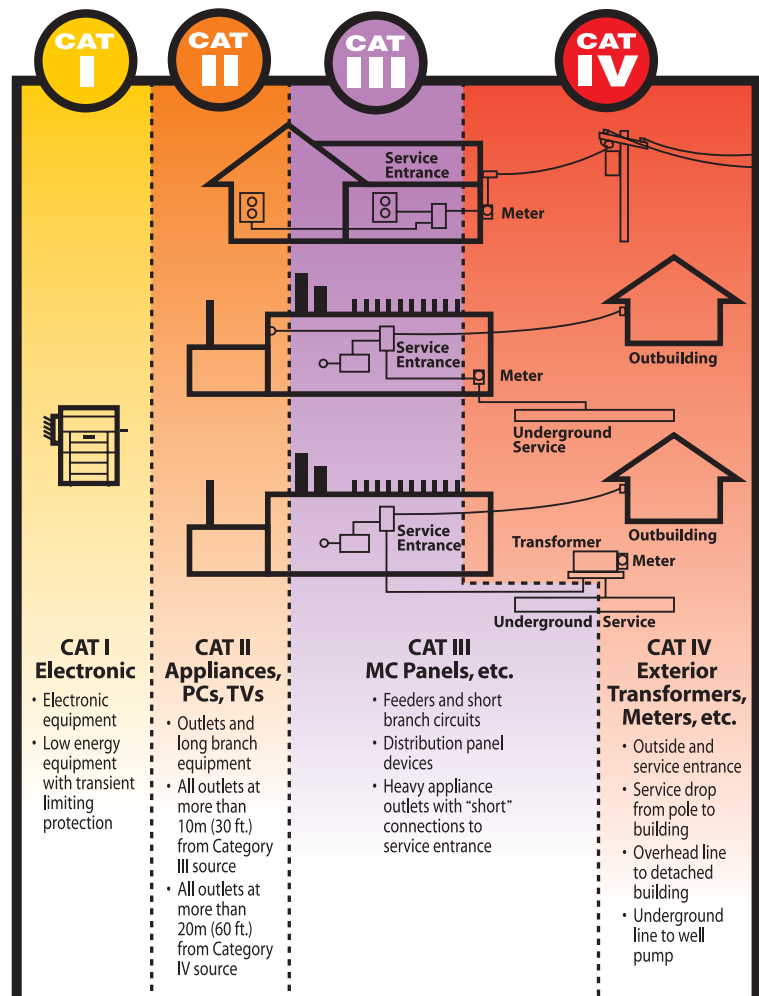

**Measurement Category III** is the distribution level - fixed primary feeders or branch circuits. These circuits are usually separated from Category IV (whether utility service or other high-voltage source) by a minimum of one level of overvoltage protection; may also be used in Category II and Category I areas.

**Measurement Category IV** is the primary supply level. Tempo is leading the way in offering protection certified to conform with the highest level of protection as specified by UL & IEC standards; may be used in all Category environments.

Tempo's Instruments - Independently tested and certified to meet the standards. Throughout this catalog, you'll see Category designations for many Tempo's instruments indicating that they comply with UL & IEC Category II, III, IV. All of these designations reflect third-party testing by independent testing organizations such as UL and ETL - added assurance for you. While there is no requirement for independent verification, we believe you deserve it.

Get the right protection for the job.

Wherever you need overvoltage protection, choose at least the rating appropriate to the type of work you expect to be doing. If you have any questions on using Tempo's test instruments to help ensure user safety, please contact Tempo Communications.
